

Quantum SVM Crash Report - Memory Allocation Failure

Crash Time: 2025-08-09 07:43:56
System Info: Linux-4.4.0-x86_64-with-glibc2.36
Python Version: 3.11.8

Crash Details:

Error: memory allocation of 20480 bytes failed Cause: Qiskit Aer statevector simulation ran out of available memory when processing 1000 samples. Likely Reason: Large feature dimension from dataset caused an excessive number of qubits, leading to exponential memory requirements.

Recommendations:

1. Reduce number of samples (e.g., from 1000 to 100). 2. Reduce feature dimensions by applying PCA or feature selection. 3. Use a more memory-efficient quantum simulator (qasm_simulator with shots instead of statevector). 4. Run on a machine with more RAM.
